1 Ans : An array is a linear data structure that stores elements of the same type in contiguous memory locations. Each element can be accessed directly using an index, which makes accessing elements fast.

Array = [10, 20, 30]

A Linked List is a linear data structure where elements are stored in seperate nodes. Each node contains data and a pointer / reference to the text node. Unlike arrays, linked lists elemente are not stored continously in memory

10 → 20 → 30 → NULL

A stack is a linear data structure that follows the LIFO principle (Last in, First out).

2 Ans :- A binary search tree (BST) is a hierarchial data structure that is a special type of binary tree used for storing and organizing data efficiently. In a BST, each node can have at most two children, known as the left child and right child

1. All nodes in the left subtree contain values smaller than the parent node.

2. All nodes in the right subtree contain values greater than the parent node

3Ans :- GET Method is used to fetch or retrieve data from the server.

POST method is used to create /add new data

PUT method is used to update data.

DELETE Method is used to delete data.
